CS-23334 FUNDAMENTALS OF DATA SCIENCE

ASHWIN C 240701058

Experiment No: 3 **Date: 07.08.2025**

3.A Handling Missing Data In a Dataset

Aim:

To demonstrate an experiment to handle missing data and inappropriate data using pandas

Algorithm:

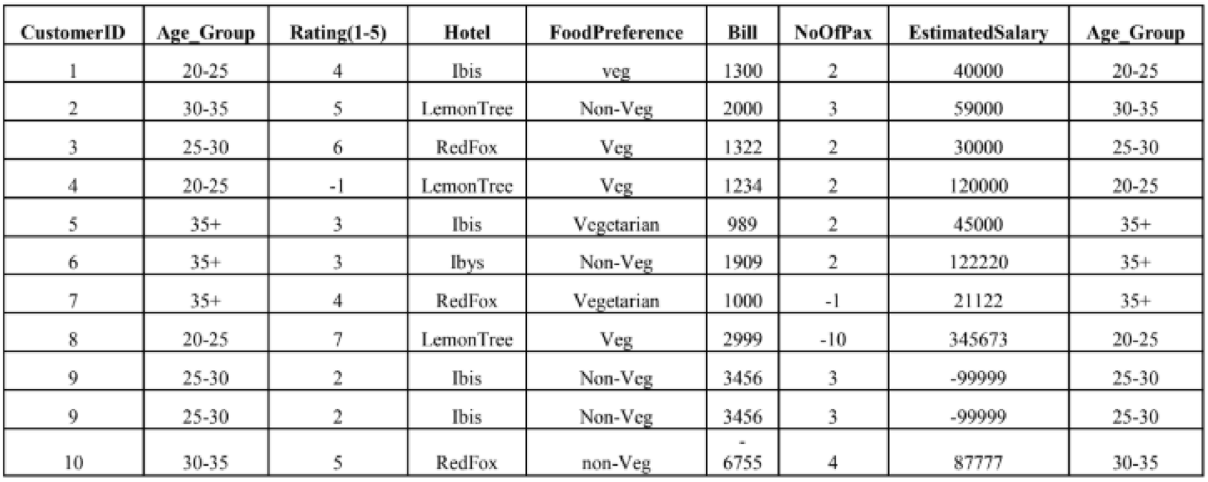
Step 1: Identify Missing Data

Step 2: Quantify and Visualize Missingness

Step 3: Decide on a Strategy (Drop, Impute, Flag)

Step 4: Apply the Chosen Method and Validate

Given Dataset:



CustomerID	Age_Group	Rating(1-5)	Hotel	FoodPreference	Bill	NoOfPax	EstimatedSalary	Age_Group
1	20-25	4	Ibis	veg	1300	2	40000	20-25
2	30-35	5	LemonTree	Non-Veg	2000	3	59000	30-35
3	25-30	6	RedFox	Veg	1322	2	30000	25-30
4	20-25	-1	LemonTree	Veg	1234	2	120000	20-25
5	35+	3	Ibis	Vegetarian	989	2	45000	35+
6	35+	3	Ibys	Non-Veg	1909	2	122220	35+
7	35+	4	RedFox	Vegetarian	1000	-1	21122	35+
8	20-25	7	LemonTree	Veg	2999	-10	345673	20-25
9	25-30	2	Ibis	Non-Veg	3456	3	-99999	25-30
9	25-30	2	Ibis	Non-Veg	3456	3	-99999	25-30
10	30-35	5	RedFox	non-Veg	-6755	4	87777	30-35

About Dataset:

No.of Columns =9 (called as series – Customer ID, Age Group, Rating(1-5),Hotel, Food Preference, Bill, No Of Pax, Estimated Salary)

CutomerID: Numerical Continuous data

Age: Categorical Data

Rating (1-5): Numerical Discrete Data

Hotel: Categorical Data

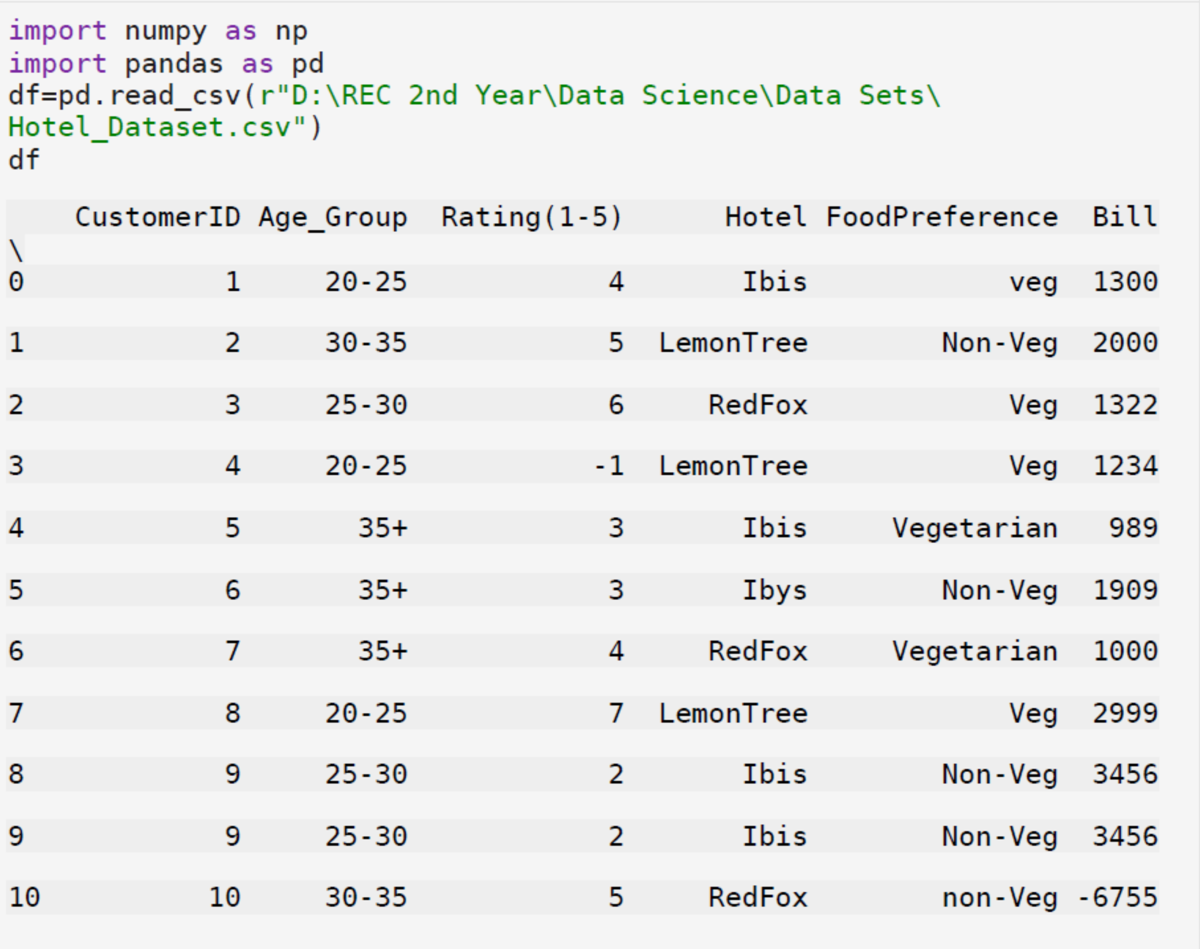
Food: Categorical Data

Bill: Numerical Continuous data

NoOfPax: Numerical Discrete

EstimatedSalary: Numerical Continuous data

Code with Output:



```
import numpy as np
import pandas as pd
df=pd.read_csv(r"D:\REC 2nd Year\Data Science\Data Sets\
Hotel_Dataset.csv")
df

    CustomerID Age_Group  Rating(1-5)      Hotel FoodPreference  Bill

8       Non-Veg
9       non-Veg
Name: FoodPreference, dtype: object>

df.FoodPreference.replace(['Vegetarian','veg'],'Veg',inplace=True)
df.FoodPreference.replace(['non-Veg'],'Non-Veg',inplace=True)
```

Result:

Thus the process of missing data values handling is carried out using pandas library in Python.

3.B Data Preprocessig In Data Science

Aim:

To understand the data preprocessing in Data Science and understand the importance of data preprocessing in data science.

Algorithm:

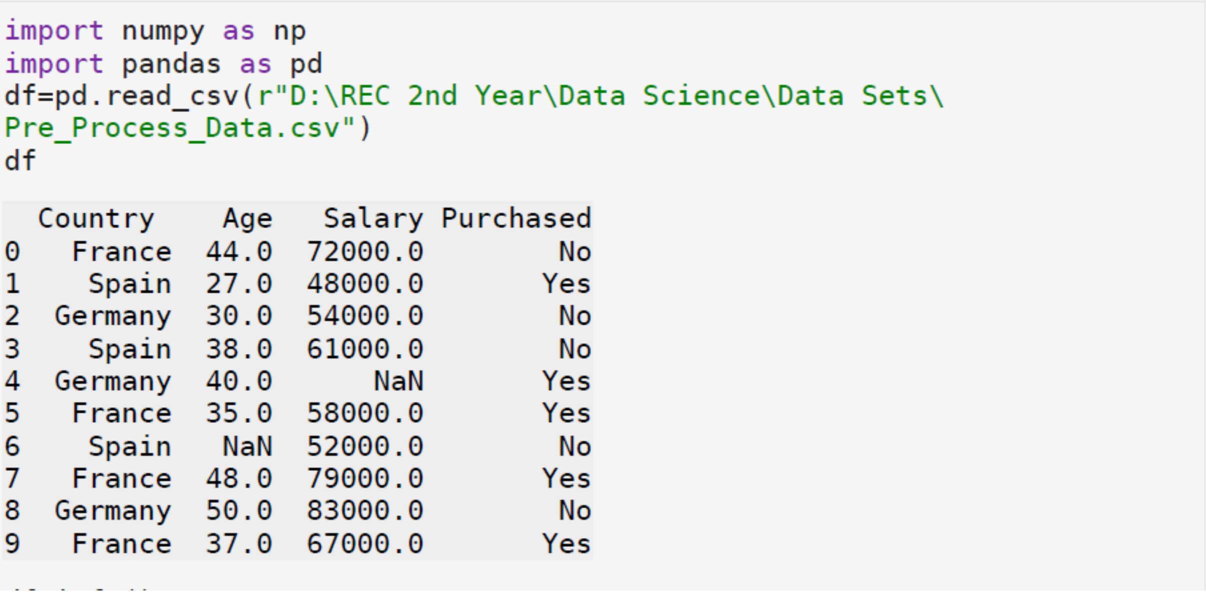
Step 1: Data Cleaning

Step 2: Data Transformation

Step 3: Feature Engineering

Step 4: Data Scaling and Encoding

Code With Output:



```
import numpy as np
import pandas as pd
df=pd.read_csv(r"D:\REC 2nd Year\Data Science\Data Sets\
Pre_Process_Data.csv")
df
```

```

3.C. Create And Save a CSV file Using Pandas

Aim:

To create a CSV File and save the file using Pandas Library in python

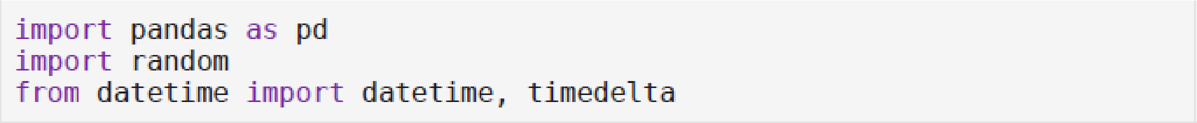
Algorithm:

1. Import Pandas
2. Prepare Data
3. Create a Dataframe
4. Save to CSV File

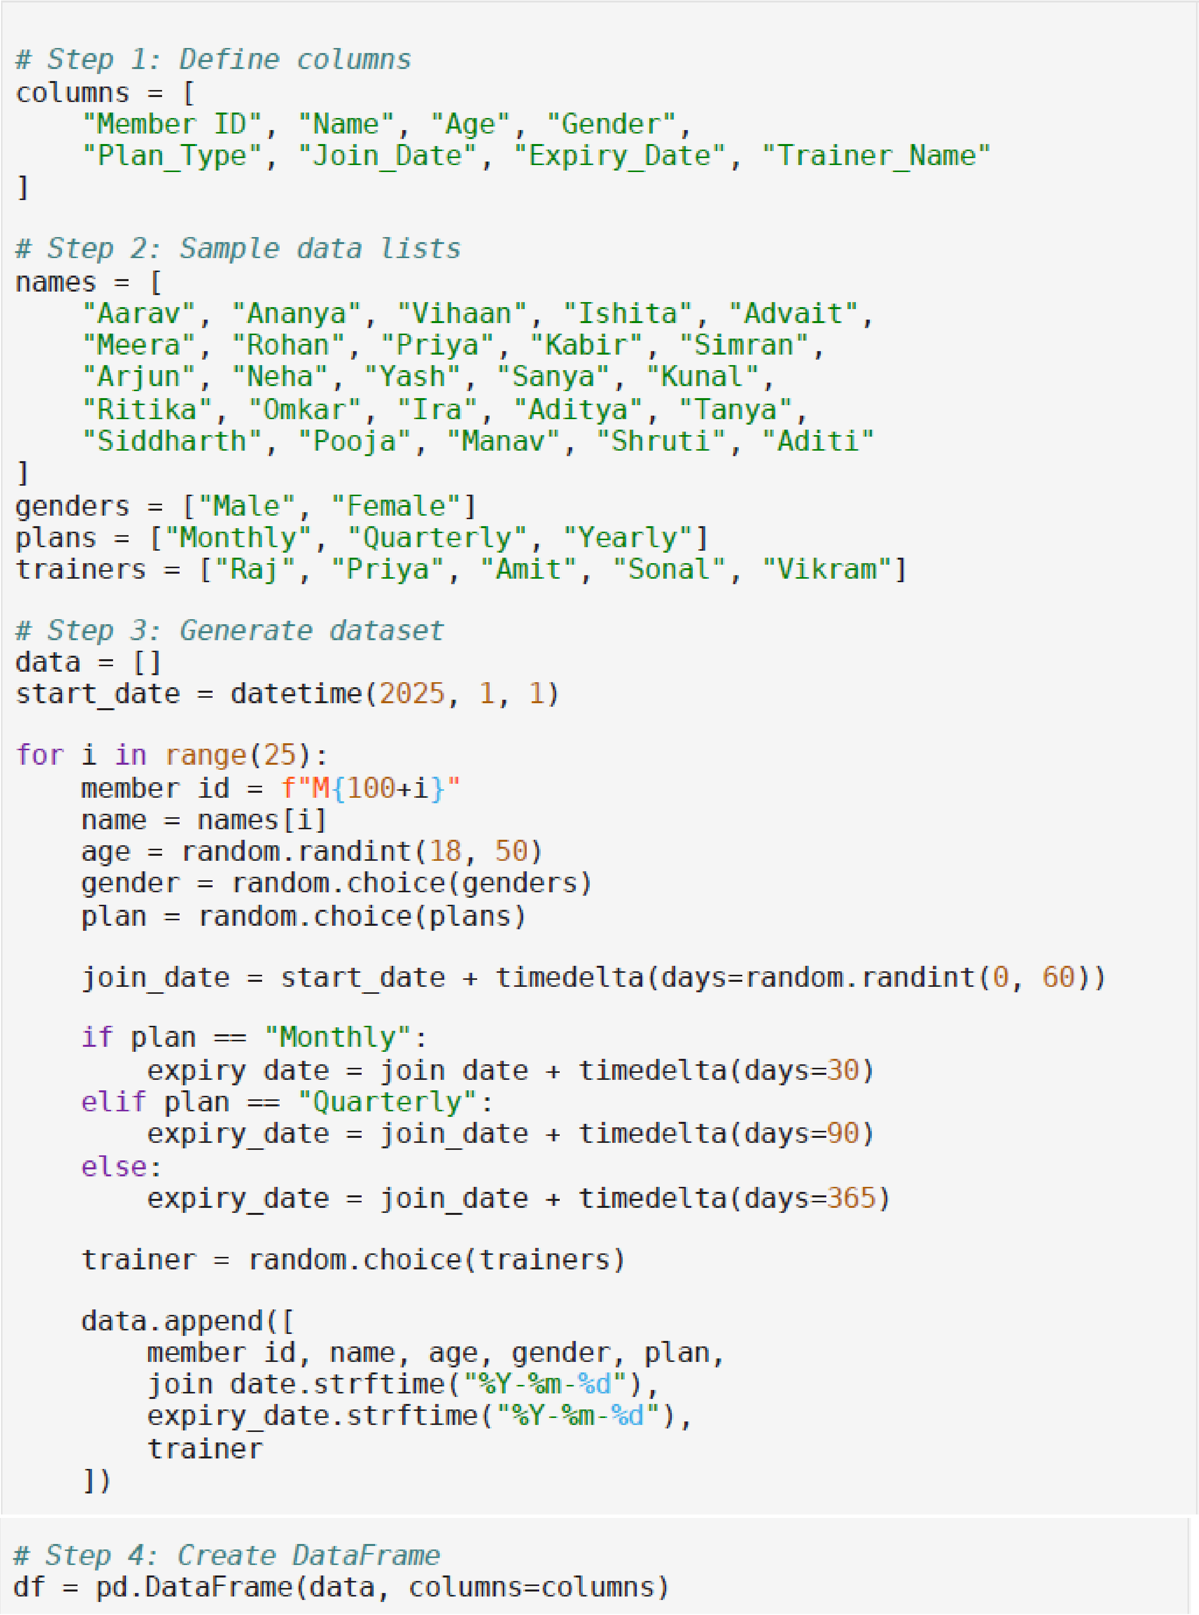
Description:

Follow Steps to create and save a file a CSV File using Pandas Library

Code With Output:



```
import pandas as pd
import random
from datetime import datetime, timedelta
```



```python
# Step 1: Define columns
columns = [
    "Member ID", "Name", "Age", "Gender",
    "Plan_Type", "Join_Date", "Expiry_Date", "Trainer_Name"
]

# Step 2: Sample data lists
names = [
    "Aarav", "Ananya", "Vihaan", "Ishita", "Advait",
    "Meera", "Rohan", "Priya", "Kabir", "Simran",
    "Arjun", "Neha", "Yash", "Sanya", "Kunal",
    "Ritika", "Omkar", "Ira", "Aditya", "Tanya",
    "Siddharth", "Pooja", "Manav", "Shruti", "Aditi"
]
genders = ["Male", "Female"]
plans = ["Monthly", "Quarterly", "Yearly"]
trainers = ["Raj", "Priya", "Amit", "Sonal", "Vikram"]

# Step 3: Generate dataset
data = []
start_date = datetime(2025, 1, 1)

for i in range(25):
    member id = f"M{100+i}"
    name = names[i]
    age = random.randint(18, 50)
    gender = random.choice(genders)
    plan = random.choice(plans)

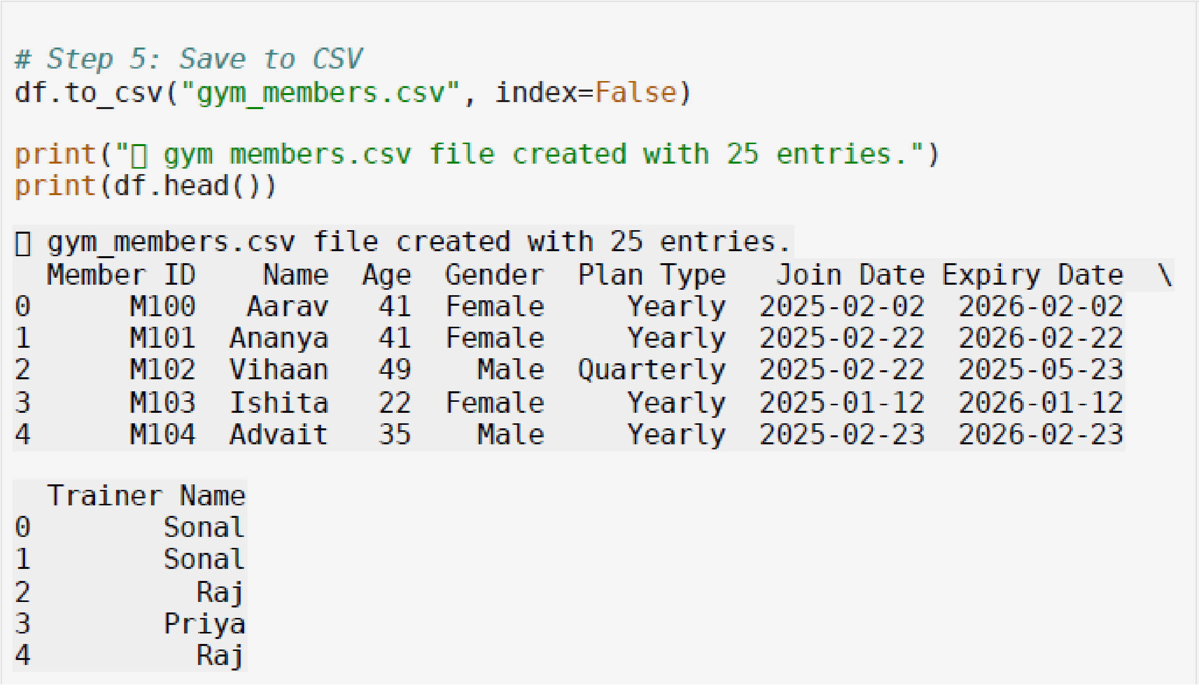
    join_date = start_date + timedelta(days=random.randint(0, 60))

    if plan == "Monthly":
        expiry date = join date + timedelta(days=30)
    elif plan == "Quarterly":
        expiry_date = join_date + timedelta(days=90)
    else:
        expiry_date = join_date + timedelta(days=365)

    trainer = random.choice(trainers)

    data.append([
        member id, name, age, gender, plan,
        join date.strftime("%Y-%m-%d"),
        expiry_date.strftime("%Y-%m-%d"),
        trainer
    ])
```

```python
# Step 4: Create DataFrame
df = pd.DataFrame(data, columns=columns)
```



```
# Step 5: Save to CSV
df.to_csv("gym_members.csv", index=False)

print(" gym_members.csv file created with 25 entries.")
print(df.head())
```

```
 gym_members.csv file created with 25 entries.
  Member ID    Name  Age  Gender  Plan Type   Join Date Expiry Date  \
0      M100   Aarav   41  Female     Yearly  2025-02-02  2026-02-02   
1      M101  Ananya   41  Female     Yearly  2025-02-22  2026-02-22   
2      M102  Vihaan   49    Male  Quarterly  2025-02-22  2025-05-23   
3      M103  Ishita   22  Female     Yearly  2025-01-12  2026-01-12   
4      M104  Advait   35    Male     Yearly  2025-02-23  2026-02-23   

  Trainer Name  
0        Sonal  
1        Sonal  
2          Raj  
3        Priya  
4          Raj  
```

Result:

Thus a dataset is created in CSV format and saved using Pandas Library
